

Project Title: Voice Input Adoption Problem – ChatGPT India Mobile App

1. Executive Summary Snapshot

People in India are using more voice features than ever, but in the ChatGPT mobile app, the voice input button isn't getting much attention. Many either don't notice it, don't trust it to understand them or don't find it useful in their everyday situation which simply means that we're missing a big chance to make ChatGPT easier, faster and user-friendlier for millions of its users. This document spells out what's going wrong, why it matters and how we'll measure success once it's fixed.

2. Project Description

The aim of this project is to define the barriers preventing effective adoption of voice input on ChatGPT's mobile app on a nationwide scale. This includes understanding **user demographics, cultural contexts, technological constraints and behavioural factors** that influence voice input usage.

3. Project Scope

In-Scope:

- Identifying businesses and product goals for voice input in the India mobile app.
- Understanding the target user segments and their current behaviours.
- Defining current and potential adoption problems that are technical, cultural or UX-related.
- Outlining functional and non-functional requirements from a problem statement perspective.
- Specifying assumptions and constraints affecting the problem space.
- Establishing measurable success criteria and KPIs for adoption improvement.

Out-of-Scope:

- Suggesting specific solutions, features or UI changes.
- Technical architecture or implementation details.
- Global voice input adoption strategy outside the Indian market.

4. Business Drivers

- **Market Opportunity:** India's internet user base exceeds 750M with rapid growth in voice search and conversational AI adoption, especially in Tier 2 & Tier 3 cities.
- **User Accessibility:** Voice input reduces typing effort especially for non-English speakers and users with low digital literacy.

- **Engagement & Retention:** Increased voice adoption can boost session frequency, query length and task completion rates.
- **Competitive Pressure:** Competing platforms (Gemini, Alexa, Siri) have set user expectations for voice experiences.
- **Monetization Potential:** Higher engagement can drive upsell potential for premium plans in India.

5. Current Process

Observed Issues:

- Low awareness of microphone function.
- Mistranscriptions in Indian languages, accents or code-mixed speech.
- Perceived latency in transcription or response.
- Social context barriers leading to reluctance to use voice in public spaces.
- Battery or data usage concerns.

6. Proposed Process

Analysing the problem at the definition level, the intended process should allow:

- **Discovery:** Users should easily notice and understand voice input capability.
- **Confidence:** Users should feel confident that their speech will be recognized accurately in their preferred language or dialect.
- **Comfort:** Users should be able to use voice input comfortably across different contexts.
- **Efficiency:** Users should complete interactions faster than typing without significant errors.

7. Functional Requirements

The following requirements must be satisfied to address the problem. These are not the solutions.

- **Input Accessibility:** Users must be able to access and initiate voice input without prior technical knowledge.
- **Language Support:** Voice input must handle multilingual and code-mixed (English + Indian language) speech patterns.

- **Recognition Accuracy:** Transcription accuracy should meet a minimum acceptable threshold for understanding across accents.
- **Awareness:** Users must know that voice input exists and understand its purpose.
- **Feedback Requirement:** Users must receive immediate and clear feedback if the voice input was not recognized correctly.

8. Non-functional Requirements

- **Performance:** Voice input response and transcription latency should be low enough to avoid user drop-off.
- **Reliability:** The feature should work consistently across network conditions common in India (including 3G).
- **Privacy & Trust:** The system should instill user confidence regarding how voice data is processed and stored.
- **Scalability:** Voice input should handle high concurrency in peak usage times without degradation.
- **Device Compatibility:** Must function on a wide range of Android and iOS devices, including lower-end models that are prevalent in India.

9. Assumptions and Constraints

Assumptions:

- The majority of target users have smartphones with working microphones.
- Users are familiar with voice-based features on other platforms (Gemini, WhatsApp voice notes, Alexa)
- Language diversity is a key factor. Code-mixing is more common than single-language usage.

Constraints:

- Development must align with existing ChatGPT mobile app architecture.
- Any enhancements must comply with Indian data protection regulations.
- Network performance varies greatly by geography and carrier.

10. Success Criteria & KPIs

Primary KPIs:

- Increase in monthly active voice input users.
- Increase in repeat usage rate for voice input.
- Reduction in drop-off rates between voice initiation and query submission.

Secondary KPIs:

- Average query length for voice vs. text.
- User satisfaction score (post-interaction survey for voice users).
- Percentage of transcription errors reported by users.

11. Timeline & Milestones

MILESTONE	DATE	OUTPUT
BRD Approval	Week 1	Get the document reviewed and agreed by all stakeholders
Research Validation	Week 2 - Week 4	Talk to users, check app data and confirm the problem details
Team Alignment	Week 5	Bring all teams together to agree on the problem and priorities
Start Solutions work	Week 6	Begin exploring and drafting possible fixes separately

12. Stakeholders

- **Product Management:** Work on problem definition and prioritizing tasks.
- **Design:** Creates user flows and interfaces based on the defined problem.
- **Engineering:** Work on feasibility and technical constraints.
- **Data Science:** Tracks KPIs, user behaviour and error rates.
- **Marketing:** Work on awareness of the feature post-improvement.
- **Legal Team:** Ensures privacy and data compliance.

13. Glossary

- **MAU-Voice:** Monthly Active Users who use voice input at least once in a month.
- **Code-Mixing:** Using more than one language in a single sentence, common in India.
- **Drop-off Rate:** Percentage of users who start but do not complete the voice query.
